- (g) 130 ml
- (h) 100 m

3.

(a) 1.212 V

(b) 100 mA

(c) 1 zs

(d) 33.9997 zs

(e) 13.1 fs

(f) 10 Ms

(g) 10 μ s

(h) 1 s

4. (a) 10^{21} m
- (b) 10^{18} m
- (c) 10^{15} m
- (d) 10^{12} m
- (e) 10^9 m
- (f) 10^6 m

5. (a) 373.15 K
- (b) 255.37 K
- (c) 0 K
- (d) 149.1 kW
- (e) 914.4 mm
- (f) 1.609 km

6. (a) 373.15 K
(b) 273.15 K
(c) 4.2 K
(d) 112 kW
(e) 528 kJ
(f) 100 W (100 J/s is also acceptable)

7. (a) $P = 550 \text{ mJ} / 15 \text{ ns} = 36.67 \text{ MW}$

(b) $P_{\text{avg}} = (550 \text{ mJ/pulse})(100 \text{ pulses/s}) = 55 \text{ J/s} = 55 \text{ W}$

8. (a) $500 \times 10^{-6} \text{ J} / 50 \times 10^{-15} \text{ s} = 10 \text{ GJ/s} = 10 \text{ GW}$

(b) $(500 \times 10^{-6} \text{ J/pulse})(80 \times 10^6 \text{ pulses/s}) = 40 \text{ kJ/s} = 40 \text{ kW}$

9. Energy = (40 hp)(1 W/ 1/745.7 hp)(3 h)(60 min/h)(60 s/ min) = 322.1 MJ

10. $(20 \text{ hp})(745.7 \text{ W/hp}) / [(500 \text{ W/m}^2)(0.1)] = 298 \text{ m}^2$

11. (a) $(100 \text{ pW/device})(N \text{ devices}) = 1 \text{ W}$. Solving, $N = 10^{10} \text{ devices}$

(b) Total area = $(1 \text{ } \mu\text{m}^2 / 5 \text{ devices})(10^{10} \text{ devices}) = 2000 \text{ mm}^2$

(roughly 45 mm on a side, or less than two inches by two inches, so yes).

12. (a) $20 \times 10^3 \text{ Wh} / 100 \text{ W} = 200 \text{ h}$

So, in one day we remain at the \$0.05/kWh rate.

$$(0.100 \text{ kW})(N \text{ 100 W bulbs})(\$0.05/\text{kWh})(7 \text{ days})(24 \text{ h/day}) = \$10$$

Solving, $N = 11.9$

Fractional bulbs are not realistic so rounding down, 11 bulbs maximum.

$$(b) \text{ Daily cost} = (1980)(\$0.10/\text{kWh})(24 \text{ h}) + (20 \text{ kW})(\$0.05/\text{kWh})(24 \text{ h}) = \$4776$$

13. Between 9 pm and 6 am corresponds to 9 hrs at \$0.033 per kWh.
Thus, the daily cost is $(0.033)(2.5)(9) + (0.057)(2.5)(24 - 9) = \2.88

Consequently, 30 days will cost \$86.40

14.
$$\frac{(9 \times 10^9 \text{ person})(100 \text{ W/person})}{(800 \text{ W/m}^2)(0.1)} = 11.25 \times 10^9 \text{ m}^2$$

15. $q(t) = 5e^{-t/2} \text{ C}$
 $dq/dt = -(5/2) e^{-t/2} \text{ C/s} = -2.5e^{-t/2} \text{ A}$

16. $q = it = (10^{-9} \text{ A})(60 \text{ s}) = 60 \text{ nC}$

17. (a) # electrons = $-10^{13} \text{ C} / (-1.602 \times 10^{-19} \text{ C/electron}) = 6.242 \times 10^{31} \text{ electrons}$

(b)
$$\left[\frac{6.242 \times 10^{31} \text{ electrons}}{\pi \left(\frac{1 \text{ cm}}{2} \right)^2} \right] \left(\frac{100 \text{ cm}}{1 \text{ m}} \right)^2 = 7.948 \times 10^{35} \text{ electrons/m}^2$$

(c) current = $(10^6 \text{ electrons/s})(-1.602 \times 10^{-19} \text{ C/electron}) = 160.2 \text{ fA}$

18. $q(t) = 9 - 10t$ C

(a) $q(0) = 9$ C

(b) $q(1) = -1$ C

(c) $i(t) = dq/dt = -10$ A, regardless of value of t

19. (a) $q = 10t^2 - 22t$
 $i = dq/dt = 20t - 22 = 0$

Solving, $t = 1.1 \text{ s}$

(b)

20. $i(t) = 114\sin 100\pi t$ A

(a) This function is zero whenever $100\pi t = \pi n$, $n = 1, 2, \dots$

or when $t = 0.01n$.

Therefore, the current drops to zero **201 times** ($t = 0, t = 0.01, \dots t = 2$)
in the interval.

(b) $q = \int_0^1 i dt = 114 \int_0^1 \sin 100\pi t = -\frac{114}{100\pi} \cos 100\pi t \Big|_0^1 = \mathbf{0 \text{ C net}}$

21. (a) Define $i_{\text{avg}} = \frac{1}{T} \int_0^T i(t) dt = \frac{1}{8} \int_0^8 t dt = 2.25 \text{ A}$

(b) $q(t) = \int_0^t i(t') dt' = \int_0^t t' dt' =$

$$\begin{aligned} &500t^2 \text{ mC}, & 0 \leq t < 6 \\ &0, & 6 \leq t < 8 \\ &500(t-8)^2 \text{ mC}, & 8 \leq t < 14 \end{aligned}$$

$$22. \quad (a) \quad i_{avg} = \frac{(3)(1) + (-1)(1) + (1)(1) + (0)(1)}{4} = 750 \text{ mA}$$

$$(b) \quad i_{avg} = \frac{(3)(1) + (-1)(1) + (1)(1)}{3} = 1 \text{ A}$$

$$(c) \quad q(t) = \int i(t) dt = \begin{cases} 3t + q(0) = 3t + 1 \text{ C}, & 0 \leq t \leq 1 \text{ s} \\ -t + q(1) = -t + 4 \text{ C}, & 1 \leq t \leq 2 \text{ s} \\ t + q(2) = t + 2 \text{ C}, & 2 \leq t \leq 3 \text{ s} \\ q(3) = 5 \text{ C}, & 3 \leq t \leq 4 \text{ s} \end{cases}$$

23. A to C = 5 pJ. B to C = 3 pJ. Thus, A to B = 2 pJ.
A to D = 8 pJ so C to D = 3 pJ

$$(a) V_{CB} = 3 \times 10^{-12} / -1.602 \times 10^{-19} = \boxed{-18.73 \text{ MV}}$$

$$(b) V_{DB} = (3 + 3) \times 10^{-12} / -1.602 \times 10^{-19} = \boxed{-37.45 \text{ MV}}$$

$$(c) V_{BA} = 2 \times 10^{-12} / -1.602 \times 10^{-19} = \boxed{-12.48 \text{ MV}}$$

$$24. \quad v_x = 10^{-3} \text{ J} / -1.602 \times 10^{-19} \text{ C} = -6.24 \times 10^{15} \text{ V}$$

$$v_y = -v_x = +6.24 \times 10^{15} \text{ V}$$

25. (a) Voltage is defined as the potential difference between two points, hence two wires are needed (one to each 'point').

(b) The reading will be the negative of the value displayed previously.

26. (a) $P_{\text{abs}} = (+6)(+10^{-12}) = 6 \text{ pW}$

(b) $P_{\text{abs}} = (+1)(+10 \times 10^{-3}) = 10 \text{ mW}$

(c) $P_{\text{abs}} = (+10)(-2) = -20 \text{ W}$

27. (a) $P_{\text{abs}} = (2)(-1) = -2 \text{ W}$

(b) $P_{\text{abs}} = (-16e^{-t})(0.008e^{-t}) = -47.09 \text{ mW}$

(c) $P_{\text{abs}} = (2)(-10^{-3})(0.1) = -200 \text{ } \mu\text{W}$

28. $P_{\text{abs}} = v_p(1)$

(a) $(+1)(1) = 1 \text{ W}$

(b) $(-1)(1) = -1 \text{ W}$

(c) $(2 + 5\cos 5t)(1) = (2 + 5\cos 5)(1) = 3.418 \text{ W}$

(d) $(4e^{-2t})(1) = (4e^{-2})(1) = 541.3 \text{ mW}$

(e) A negative value for absorbed power indicates the element is actually supplying power to whatever it is connected to.

29. $P_{\text{supplied}} = (2)(2) = 4 \text{ W}$

30. (a) Short circuit corresponds to zero voltage, hence $i_{sc} = 3.0 \text{ A}$.
- (b) Open circuit corresponds to zero current, hence $v_{oc} = 500 \text{ mV}$.
- (c) $P_{\max} \approx (0.375)(2.5) = 938 \text{ mW}$ (near the knee of curve)

31. Looking at sources left to right,

$P_{\text{supplied}} =$

$(2)(2)$	$= 4 \text{ W};$
$(8)(2)$	$= 16 \text{ W};$
$(10)(-4)$	$= -40 \text{ W};$
$(10)(5)$	$= 50 \text{ W};$
$(10)(-3)$	$= -30 \text{ W}$

Note these sum to zero, as expected.

32. The remaining power is leaving the laser as heat, due to losses in the system. Conservation of energy requires that the total output energy, regardless of form(s), equal the total input energy.

33. (a) $V_R = 10 \text{ V}$, $V_x = 2 \text{ V}$

$$P_{\text{abs}} =$$

$$(2)(-10) = -20 \text{ W};$$

$$(10)(10) = 100 \text{ W};$$

$$(8)(-10) = -80 \text{ W}$$

(b) element A is a passive element, as it is absorbing positive power

34. (a) $V_R = 100\text{ V}$, $V_x = 92\text{ V}$

$$P_{V_x(\text{supplied})} = (92)(5V_x) = (92)(5)(92)$$

$$= 42.32\text{ kW}$$

$$P_{V_R(\text{supplied})} = (100)(-5V_x) = -100(5)(92)$$

$$= -46.00\text{ kW}$$

$$P_{5V_x(\text{supplied})} = (8)(5V_x) = (8)(5)(92)$$

$$= 3.68\text{ W}$$

(b) $42.32 - 46 + 3.68 = 0$

35. $i_2 = -3v_1$ therefore $v_1 = -100/3 \text{ mV} = -33.33 \text{ mV}$

36. First, it cannot dissipate more than 100 W and hence $i_{\max} = 100/12 = 8.33$ A

It must also allow at least 12 W or $i_{\min} = 12/12 = 1$ A

10 A is too large; 1 A is just on the board and likely to blow at minimum power operation, so 4 A is the optimum choice among the values available.

37. $(-2i_x)(-i_x) = 1$

Solving, $i_x = 707 \text{ mA}$

38. (a) $10^{-3}/4.7 \times 10^3 = 210 \text{ nA}$
- (b) $10/4.7 \times 10^3 = 2.1 \text{ mA}$
- (c) $4e^{-t}/4.7 \times 10^3 = 850e^{-t} \mu\text{A}$
- (d) $100\cos 5t / 4.7 \times 10^3 = 21\cos 5t \text{ mA}$
- (e) $\left| \frac{-7}{4.7 \times 10^3} \right| = 1.5 \text{ mA}$

39. (a) $(1980)(0.001) = 1.98 \text{ V};$
 $(2420)(0.001) = 2.42 \text{ V}$
- (b) $(1980)(4 \times 10^{-3} \sin 44t) = 7.92 \sin 44t \text{ V};$
 $(2420)(4 \times 10^{-3} \sin 44t) = 9.68 \sin 44t \text{ V}$

40. $I = V/R$; $I_{\min} = V_{\min}/R = -10/2000 = -5 \text{ mA}$

$I_{\max} = V_{\max}/R = +10/2000 = 5 \text{ mA}$

(b) slope = $dI/dV = 5 \times 10^{-3}/10 = 500 \mu\text{s}$

41. We expect the voltage to be 33 times larger than the current, or $92.4 \cos t$ V.

42. (a) $R = 5/0.05 \times 10^{-3} = 100 \text{ k}\Omega$

(b) $R = \infty$

(c) $R = 0$

43. (a) ∞

(b) 10 ns

(c) 5 s

44. $G = 10 \text{ mS}; R = 1/G = 100 \ \Omega$

(a) $i = 2 \times 10^{-3} / 100 = 20 \ \mu\text{A}$

(b) $i = 1 / 100 = 10 \ \text{mA}$

(c) $i = 100e^{-2t} / 100 = e^{-2t} \ \text{A}$

(d) $i = 0.01(5) \sin 5t = 50 \sin 5t \ \text{mA}$

(e) $i = 0$

45. (a) $i_{lo} = 9/1010 = 8.91 \text{ mA};$
 $i_{hi} = 9/990 = 9.09 \text{ mA}$
- (b) $P_{lo} = 9^2/1010 = 80.20 \text{ mW};$
 $P_{hi} = 9^2/990 = 81.82 \text{ mW}$
- (c) $9/1100 = 8.18 \text{ mA};$
 $9/900 = 10 \text{ mA};$
 $9^2/1100 = 73.6 \text{ mW};$
 $9^2/900 = 90.0 \text{ mW}$

46. (a) Plotting the data in the table provided,

(b) A best fit (using MATLAB fitting tool in plot window) yields a slope of $2.3 \text{ k}\Omega$.

However, this is only approximate as the best fit does not intersect zero current at zero voltage.

47. Define I flowing clockwise. Then

$$P_{V_s}(\text{supplied}) = V_s I$$

$$P_{R_1}(\text{absorbed}) = I^2 R_1$$

$$P_{R_2}(\text{absorbed}) = (V_{R_2})^2 / R_2$$

$$\text{Equating, } V_s I = I^2 R_1 + (V_{R_2})^2 / R_2 \quad [1]$$

$$\text{Further, } V_s I = I^2 R_1 + I^2 R_2$$

$$\text{or } I = V_s / (R_1 + R_2) \quad [2]$$

We substitute Eq. [2] into Eq. [1] and solve for $(V_{R_2})^2$:

$$(V_{R_2})^2 = V_s^2 \left[\frac{R_2^2}{(R_1 + R_2)^2} \right] \text{ hence } V_{R_2} = V_s \left[\frac{R_2}{R_1 + R_2} \right]. \quad \boxed{\text{QED.}}$$

48. TOP LEFT:	$I = 5/10 \times 10^3$	$= 500 \mu\text{A}$
	$P_{\text{abs}} = 5^2/10 \times 10^3$	$= 2.5 \text{ mW}$
TOP RIGHT:	$I = -5/10 \times 10^3$	$= -500 \mu\text{A}$
	$P_{\text{abs}} = (-5)^2/10 \times 10^3$	$= 2.5 \text{ mW}$
BOTTOM LEFT:	$I = -5/10 \times 10^3$	$= -500 \mu\text{A}$
	$P_{\text{abs}} = (-5)^2/10 \times 10^3$	$= 2.5 \text{ mW}$
BOTTOM RIGHT:	$I = -(-5)/10 \times 10^3$	$= 500 \mu\text{A}$
	$P_{\text{abs}} = (-5)^2/10 \times 10^3$	$= 2.5 \text{ mW}$

49. Power = V^2/R so

50. <DESIGN>

One possible solution:

$$R = \rho \frac{L}{A} = \frac{L}{A(qN_D\mu_n)} = 10.$$

Select $N_D = 10^{14}$ atoms/cm², from the graph, $\mu_n = 2000$ cm²/Vs.Hence, $qN_D\mu_n = 0.032$, so that $L/A = 0.32$ μm^{-1} .Using the wafer thickness as one dimension of our cross sectional area A, $A = 300x$ μm^2 and y is the other direction on the surface of the wafer, so $L = y$.Thus, $L/A = y/300x = 0.32$. Choosing $y = 6000$ μm , $x = 62.5$ μm .

Summary: Select wafer with phosphorus concentration of 10^{14} atoms/cm³, cut surface into a rectangle measuring 62.5 μm wide by 6000 μm long. Contact along narrow sides of the 6000 μm long strip.

51. $\rho = (qN_D\mu_n)^{-1}$. Estimating μ_n from the graph, keeping in mind “half-way” on a log scale corresponds to 3, not 5,

52. <DESIGN> One possible solution:

We note 28 AWG wire has a resistance of 65.3 ohms per 1000 ft length (at 20°C).

There, 1531 ft is approximately 100 ohms and 7657 ft is approximately 500 ohms.

These are huge lengths, which reinforces the fact that copper wire is a very good conductor.

*Wrap the 7657 ft of 28 AWG wire around a (long) nonconducting rod.

*Connect to the left end.

*The next connection slides along the (uninsulated) coil. When connection is approximately 20% of the length as measured from the left, $R = 100$ ohms. When it is at the far (right) end, $R = 500$ ohms.

53. 14 AWG = 2.52 ohms per 1000 ft.
 $R = (500 \text{ ft})(2.52 \text{ ohms}/1000 \text{ ft}) = 1.26 \text{ ohms}$

$$P = I^2R = (25)^2(1.26) = 787.5 \text{ W}$$

54. (a) 28 AWG = 65.3 ohms per 1000 ft therefore length = $1000(50)/65.3 = 766$ ft

(b) $110.5^{\circ}\text{F} = 43.61^{\circ}\text{C}$

Thus, $R_2 = (234.5 + 43.61)(50)/(234.5 + 20) = 54.64$ ohms

We therefore need to reduce the length to $50(766)/54.64 = 701$ ft

55. <Design> One possible solution:

Choose 28 AWG wire. Require $(10)(100)/(65.3) = 153$ feet (rounding error within 1% of target value). Wrap around 1 cm diameter 47 cm long wooden rod.

56. B415 used instead of B33; gauge unchanged.

The resistivity is therefore $8.4805/1.7654 = 4.804$ times larger

(a) With constant voltage, the current will be $(100/4.804) = 20.8\%$ of expected value

(b) No additional power will be wasted since the error leads to lower current: $P = V/R$ where $V =$ unchanged and R is larger (0%)

57. $R = \rho L/A = (8.4805 \times 10^{-6})(100)(2.3/7.854 \times 10^{-7}) = 2483 \Omega$

$P = i^2 R$ so

B415: 2.48 mW; B75: 504 μ W

58. $\beta = 100, I_B = 100 \mu\text{A}$

(a) $I_C = \beta I_B = 10 \text{ mA}$

(b) $P_{BE} = (0.7)(100 \times 10^{-6}) = 70 \mu\text{W}$

59. Take the maximum efficiency of a tungsten lightbulb as 10%. Then only ~10 W (or 10 J/s) of optical (visible) power is expected. The remainder is emitted as heat and invisible light.

60. Assuming the batteries are built the same way, each has the same energy density in terms of energy storage.

The AA, being larger, therefore stores more energy.

Consequently, for the same voltage, we would anticipate the larger battery can supply the same current for longer, or a larger maximum current, before discharging completely.

1. (a) 5 nodes
- (b) 7 elements
- (c) 7 branches
